

To get standard images that hopefully give a better understanding of what the users having this issue are suffering with I am providing images of the menus. I believe strongly it is a setting within Photoshop Elements, so the changes are all made within the program.

The menus will all be snipped using full screen mode and resized 2.69 X 5 therefore it is clear that what you are seeing is what we are seeing.

To make the changes I went to EDIT --- PREFERENCES ---- DISPLAY & CURSORS ---UI SCALE FACTOR I changed the options and closed and restarted the program between each setting.

UI scale factor AUTOMATIC

The image to the right is what happens if I place the UI scale factor at automatic - Clearly the (title) words are not the same size as the drill-down words. They are additionally not proportional either. It is clear it is only an issue with the drill-down menu the actions are displayed fine.

UI scale factor 100%

The image to the right is what happens if I place the UI scale factor at 100% - Clearly the (title) words are not the same size as the drill-down words. Clearly this is not an acceptable option it is extremely small, to the point it is difficult to click if you are using any speed at all. The action menu also adjusted in size to be very small.

UI scale factor 200%

The image to the right is what happens if I place the UI scale factor at 200% - Clearly the (title) words are not the same size as the drill-down words. They are additionally not proportional either. In my opinion it looks the same as the automatic.
